- AB J07045132 The tape comprises coating layer consisting of porous material, the surface and inside being mutually connected through continuous pores. The coating layer is formed by applying mixt., made of 100 pts. wt. water-soluble resin, 300-3000 pts. wt. water-absorbing resin, 230-150 pts. wt. inorganic material powder and 200-2000 pts. wt. solvent, on one surface or both surfaces of supporting material, then drying the applied mixt.
 - The inorganic material powder pref. comprises one of or mixt. of carbonate, sulphate, metal oxide, silicic acid and silicate.
 - In an example, 100 pts. wt. of acrylic resin (water-soluble resin) (TRM-SK dyne 1191 supplied by Soken Kagaku KK), 1000 pts. wt. polyacrylic acid salt (water-absorbing resin) (RTM Aqualic SC supplied by Nippon Shokubai KK), 300 pts. wt. methyl alcohol and 20 pts. wt. of calcium carbonate powder were mixed. The mixt. was applied on one surface of polyester spun bonded unwoven cloth, then dried at 1230 deg. C to prepare the tape of 300 microns in thickness and 30 cm in width.
 - USE/ADVANTAGE The tape is used for prevention of water penetration towards longitudinal direction or inside direction of the power cable or the cable for communication. Water absorbing rate of the water-stopping tape was improved avoiding peeling-off of water absorbing resin.
